FileWriter

Java FileWriter class is used to write character-oriented data to a file. It is character-oriented class which is used for file handling in java.

Unlike FileOutputStream class, you don't need to convert string into byte array because it provides method to write string directly.

```java
import java.io.FileWriter;
import java.io.IOException;

class FileWriterClass {
    public static void main(String []args) throws IOException{
        System.out.println("Started......");
        FileWriter output = new
FileWriter("/home/neha/java.info/testFile");
        output.write("New Testing value....");// write string or array of
chars (character-oriented data is written to a file)
        output.close();
        System.out.println("Finished......");
    }
}
```
