BufferedInputStream

Java BufferedInputStream class is used to read information from stream. It internally uses buffer mechanism to make the performance fast.

```java
import java.io.BufferedInputStream;
import java.io.FileInputStream;
import java.io.IOException;

class BufferedInputStreamClass {
    public static void main(String []args) throws IOException{
        System.out.println("Started......");
        FileInputStream input = new
FileInputStream("/home/neha/java.info/testFile");
        BufferedInputStream buffer = new BufferedInputStream(input);
//public class BufferedInputStream extends FilterInputStream
        int i=buffer.read();
        while(i != -1){
            System.out.print((char)i);
            i=buffer.read();
        }
        buffer.close();
        input.close();
        System.out.println();
        System.out.println("Finished......");
    }
}
```
